#### 1 Document conventions

The following typographical conventions are used throughout this guide:

|           | represents command-line commands, options, parameters, directory names and filenames |
|-----------|--|
| Next >    | used to signify clickable buttons on a GUI dialogue                                  |
| No<br>te: | describes something of importance related to the current topic                       |

#### 2 Overview

This document describes the essential elements of **Bare Machine Recovery for NetWorker (NBMR)** and Disaster Recovery based upon a tailored WinPE5 or WinPE10 recovery module. It is based upon version 9.5.1 of the software.

This document describes the steps required to install, configure and use the Bare Machine Recovery for NetWorker (NBMR) product. Refer to the product Readme for installation requirements and late breaking information associated with this release.

#### 2.1 Prerequisites

Note: Please refer to the product Readme for the supported operating systems, RAM and free disk space required. A full list of supported Dell EMC NetWorker™ clients and servers is included in the Readme.

Ensure that the Dell EMC NetWorker<sup>TM</sup> backup client is installed and configured correctly.

#### 2.2 Backup Process

NBMR allows you to perform a bare machine recovery of your system direct from an Dell EMC NetWorker™ backup.

To do this you must first prepare your system using the process outlined below:

#### Installation (refer to the NBMR Installation and Licensing Guide)

- Install the NBMR configuration software on the client system to be protected
- License the software (using a Trial or Full license)

#### Configuration

- Save the configuration parameters.
- Install and run the Cristie Recovery ISO Producer (CRISP) tool on a suitable system to create the NBMR WinPE5 or WinPE10 based DR environment. This only needs to be done once per client version you wish to support.

#### Backup system and user data

Perform regular standard Dell EMC NetWorker™ backups as required

You will then be ready to <u>Restore the system from the Disaster Recovery Backup</u>.

#### 2.3 Recovery Process

In the event of a disaster, having previously taken an Dell EMC NetWorker<sup>™</sup> backup of the system and stored the configuration information, Windows WinPE5 or WinPE10 mode DR enables you to restore your system to the state at the last Dell EMC NetWorker<sup>™</sup> backup.

The NBMR recovery console must be created first by using the Cristie Recovery ISO

Producer (CRISP) tool. The output from this tool is a bootable WinPE5 or WinPE10 ISO which can be either burnt to physical CD/DVD media, imaged to a USB flash drive or used directly in a virtual environment.

If your machine supports bootable USB flash drives or CDs, this is the most convenient way to boot the DR module. If the system does not support bootable USB flash drives or CDs, you can boot from the network. Contact Cristie for details on how to set this up.

Windows WinPE5 or WinPE10 offers several advantages, namely:

- A familiar Windows GUI
- The ability to inject new mass storage drivers during the boot process
- All variations of Windows dynamic disks are supported (ie. mirrored, spanned, striped and RAID-5)
- NTFS volumes/partitions are created natively
- Support for NTFS mounted folders (junctions) and hard links
- The restored backup contains the original file security information
- BIOS (MBR) to UEFI (GPT) conversion on recovery

The WinPE5 or WinPE10 recovery process has five main steps:

- 1. Load Configuration data
- 2. Rebuild storage devices (hard disks)
- 3. Restore OS files from an Dell EMC NetWorker™ backup
- 4. Dissimilar Hardware and inject new drivers (if necessary)
- 5. Boot into the recovered system

#### 3 Create The Bootable Recovery Environment

The supplied CRISP tool is used to create the NBMR recovery environment. This environment is based upon a customised version of Microsoft's WinPE version 5 (WinPE5) or 10 (WinPE10).

Cristie Software Ltd. recommend using the WinPE10 based environment if possible. This is based upon Windows 10 and is more likely to be compatible with modern hardware. Use the WinPE5 legacy version for Windows 2012R2 or earlier.

Once created the recovery environment is booted on the target system and then manages the restore process.

The CRISP tool should be run in conjunction with the supplied CRISP WinPE5 and WinPE10 Filesets for NBMR 9.5. The fileset(s) should be installed alongside the CRISP on the same host.

NBMR requires a specific Dell EMC NetWorker<sup>™</sup> client to be added during the creation of the NBMR recovery environment ISO. You will need to specify or browse to a folder containing the appropriate Dell EMC NetWorker<sup>™</sup> 64-bit (WinPE5/WinPE10) client installation executable file (with file extension .EXE). An example of this is NetWorker-19.6.0.1.exe. This is important; it will not be possible to create the bootable recovery ISO/USB flash drive without this Dell EMC NetWorker<sup>™</sup> client installation file.

Note: Always use a 64-bit (x64) version for WinPE5/WinPE10 based builds.

You will need to create separate ISOs/USB flash drives for each Dell EMC NetWorker™ client used. Use an ISO/USB flash drive version that corresponds to the client version used for the backup. So, for example, use an ISO/USB flash drive created with the Dell EMC NetWorker™ client version 19.6.0.1 to match backups made with that version.

A full discussion of how to install and run CRISP is contained in the separate **CRISP User Guide**. Note that CRISP does not need to be installed on the system to be backed up; any suitable host machine will do.

Output from the CRISP tool is either a bootable WinPE5 or WinPE10 ISO file which can then be burnt to physical media (CD or DVD) or mounted directly in a VM environment or a bootable USB flash drive. This media is then booted on the target machine to manage the recovery operation.

Note: Microsoft Powershell is now available in the WinPE5 or WinPE10 DR environments. However this option must be selected when you create the ISO or bootable USB flash drive.

#### 4 The NBMR Create Configuration Tool

Configuration information is saved by default to the **NBMRCFG** folder on the Windows system partition. This cannot be changed.

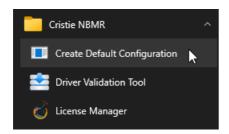

The Cristie tool that provides this function is called **NBMRCfg.exe** which is located in the NBMR installation folder (normally **Program Files\Cristie\NBMR**). This is a command line only tool which is licensed for use initially for a 30 day trial period. A full licence is required to use the program beyond the trial period.

As part of this process, details about the hard disks, operating system, storage controller (s), network adapter(s) and network settings will be queried and stored. You can override some of these details if you wish. The result of the configuration creation (success or failure) is recorded in the Windows Application Event Log.

The next sections discuss this process in more detail.

#### 4.1 Creating the Configuration Information

The easiest way to create the configuration manually is to select the <u>Create Default Configuration</u> shortcut provided on the Start menu for NBMR. Note however that an initial configuration is created during the NBMR installation process.

This will create a new configuration using the default settings.

```
NBMR Configuration Utility Version 9.5 for x64
Copyright (C) 2009-2023 Cristie Software Limited

Copying the EFI files ...
Successfully copied the EFI files
Created a snapshot of C:\ --> A:\
Searching for files missed under C:\Users ...
Searching for files missed under C:\Windows\ServiceProfiles ...
Searching for files missed under C:\Windows\WinSxS ...
Successfully copied the missed assembly directory
Searching for files missed under C:\Windows\System32 ...
Authentication files were stored successfully.
Configuration was stored successfully
```

If you need to select non-default settings, then you will need to create the configuration manually. Run a command window and navigate to the folder where NBMR is installed.

The NBMR configuration program is called **NBMRCfg.exe**. Enter the command NBMRCfg. exe /?. This will display the command line options available.

The command line options are very simple:

/help or /?

shows NBMRCfg usage. This displays the command option summary.

#### /format < Drives to format | all>

The /format option allows disk volumes other than the Windows drive to be formatted during the recovery. By default, only the Windows volume will be formatted. There is an exception to this if Windows is not contained within the first partition of the disk. In that case both the Boot partition and the Windows partition will be configured for formatting. However, regardless of this setting, the WinPE5 or WinPE10 based recovery environment will allow any or all partitions to be formatted.

So, for example, if volumes D:, E: and F: are to be additionally formatted during recovery, enter:

NBMRCfg.exe /format D, E, F (separate the drive letters using a comma)

Enter the following to back up all partitions on all drives on the system:

```
NBMRCfg.exe /format all
```

Volumes mounted on local folders not having a drive letter can be specified like this:

```
NBMRCfg.exe /format D:\MountedVolume
```

where D:\MountedVolume is the folder mount point. An example using both normal partitions and a mounted volume is:

```
NBMRCfg.exe /format D,D:\MountedVolume
```

**NBMRCfg** stores the configuration in a <code>%SystemDrive%\NBMRCFG</code> folder (where <code>%SystemDrive%</code> is the drive associated with the Windows folder, usually c:\). This location cannot be changed and will be created if not already present.

Note: it is important to remember that the NBMR configuration should be created before the Dell EMC NetWorker<sup>TM</sup> backup is made. However, in an Enterprise environment it is not practical to create the configuration information interactively like this. In this case Cristie suggests this is done by creating a server side prebackup task for the client schedule containing a script that calls the NBMRCfg.exe program installed in the NBMR installation folder.

#### 4.2 Backup of Boot and SystemState Files

On all Windows OS's, files additional to the standard Dell EMC NetWorker<sup>™</sup> backup datasets must be copied and saved. These include boot files and SystemState objects which are not normally backed up by the Dell EMC NetWorker<sup>™</sup> client on these OS's.

Some of the additional files backed up are also locked at the time of backup and must be backed up using Microsoft's Open File Manager **VSS**. So when NBMRCfg runs, it invokes VSS to take a snapshot copy of these extra files (see below).

```
NBMR Configuration Utility Version 9.5 for x64
Copyright (C) 2009-2023 Cristie Software Limited

Copying the EFI files ...
Successfully copied the EFI files
Created a snapshot of C:\ --> A:\
Searching for files missed under C:\Users ...
Searching for files missed under C:\Windows\ServiceProfiles ...
Searching for files missed under C:\Windows\WinSxS ...
Successfully copied the missed assembly directory
Searching for files missed under C:\Windows\System32 ...
Authentication files were stored successfully.
Configuration was stored successfully
```

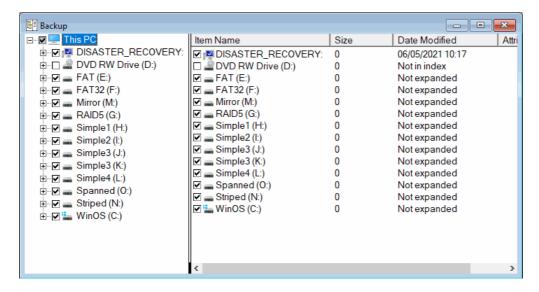

Note: you will only see the screen above when you manually create the configuration from the Start Menu shortcut. At install time, NBMRCfg.exe runs in the background at the end of the installation process.

# 5 Using a Dell EMC NetWorker™ Backup for Disaster Recovery

NBMR allows a previously created Dell EMC NetWorker<sup>™</sup> backup to be used as a DR backup.

It is important that all the VSS, SYSTEM STATE and DISASTER\_RECOVERY components are selected for backup. The actual components vary according to the Windows OS type and Dell EMC NetWorker<sup>TM</sup> client version being used. For example, the diagram below shows the Dell EMC NetWorker<sup>TM</sup> user client configured to backup all VSS and Disaster Recovery components on a Windows 2019 host with client version 19.6.0.1.

Ensure you do not select any CD/DVD or floppy drives for the backup.

Deselect any FAT, FAT32 or exFAT formatted volumes. These may cause the backup to fail.

As long as the NBMR configuration has been created (see previous section) and a full VSS Dell EMC NetWorker<sup>TM</sup> backup is performed afterwards, then it will be possible to recover the system using the DR environment.

Note: this document does not describe how to create Dell EMC NetWorker™ backups. Please refer to your Dell EMC NetWorker™ Administrator's Guide for details

Alternatively run the backup from the server-side.

Note: When using a NBMR backup to recover a Windows Domain Controller the recovered system will boot twice.

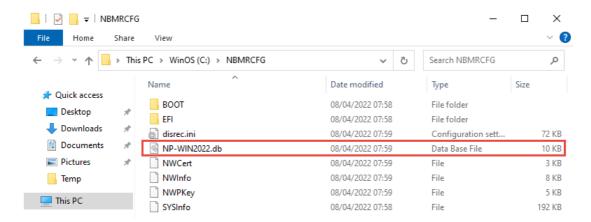

#### 5.1 Server Trust Authentication Database

If you are using Dell EMC NetWorker<sup>™</sup> server version 19.4 or later a server **Trust** file must be created to enable successful recoveries. This is used to establish authentication to the server.

The trust file is created after a run of the NBMR configuration tool **NBMRCfg.exe** (located in the installation NBMR folder) after the host has registered with the server. If the host has never run a backup or has never registered with the server before <u>please run the NBMRCfg.exe manually after the first backup</u> to create this file and then save it to a network location. See <u>The NBMR Create Configuration Tool</u> section for a full discussion of this tool.

If the host has already connected to the server prior to installing NBMR then the trust file will be found in the **%SystemDrive**%\**NBMRCFG** folder.

Copy the <hostname>.db file (NP-WIN2022.db in the example above) to an available network share or external device such as a USB drive. This must be accessible when performing recoveries in the future.

#### 5.2 Password Protected, Encrypted and Compressed Backups

NBMR also supports Dell EMC NetWorker™ Password Protected, Encrypted and Compressed backups. Note that these three options are mutually exclusive for the same partition (a Dell EMC NetWorker™ restriction). However it is possible to have multiple partitions say some encrypted, some clear, some compressed and others password protected.

For **Password Protected** backups the password is cached by the server and is not prompted for during the recovery. However, for **Encrypted backups**, a password prompt will be displayed during the DR sequence whenever an encrypted dataset is being recovered. When prompted please enter the same password setup during the backup.

Note 1: Cristie recommends using a single password for the entire encrypted backup. With Dell EMC NetWorker™ it is possible to backup parts of the system with a different password. This could lead to confusion during the recovery and is discouraged.

Note 2: Not all Dell EMC NetWorker™ clients support encrypted backups. Please check whether encryption is supported in the version of client in use.

Note 3: Compressed backups do not require any special processing by NBMR.

#### 6 Restoring your System

This section discusses the steps required to run a recovery sequence using the NBMR Recovery Environment. This is booted from the media created by CRISP in conjunction with the CRISP WinPE5 and WinPE10 Filesets for NBMR 9.5 (see <u>Create the bootable cloning environment</u> for further details).

The WinPE5 or WinPE10 based recovery environment is booted on the *target* system. This could be the original or a dissimilar system.

A typical NBMR recovery sequence consists of the following steps.

- Install and run the Cristie Recovery ISO Producer (CRISP) tool on a suitable system to create the NBMR WinPE5 or WinPE10 based recovery environment either as a CD/ DVD ISO image or direct to a USB flash drive. This only needs to be done once per Dell EMC NetWorker<sup>TM</sup> client used.
- 2. Boot the WinPE5 or WinPE10 NBMR recovery environment on the target system.
- 3. Run a restore sequence from the recovery environment on the **target** system using the Dell EMC NetWorker™ backup created previously.
- 4. When the restore operation is complete and, before booting the system, you may change the hostname and IP address as required. If the target system uses different hardware from the source system inject additional drivers into the system using the hardware wizard tool. This tool will detect any new devices in the target system and prompt for the drivers.
- 5. Boot the recovered system

Note: It is important that the correct version of the DR ISO/USB flash drive is used for recovery. Use an ISO/USB flash drive version that corresponds to the client version used for the backup. So, for example, use the ISO/USB flash drive created with the embedded Dell EMC NetWorker<sup>TM</sup> client version 19.6.0.1 when recovering a backup from a server that used version 19.6.0.1 to perform the backup.

#### 6.1 Booting the WinPE5 or WinPE10 DR Console

Insert the bootable NBMR WinPE5 or WinPE10 DR CD/DVD or USB flash drive and reboot the machine. By default you will be prompted to **Press any key to boot from the CD or DVD** unless you have disabled this feature when creating the ISO/USB flash drive in CRISP.

#### Press any key to boot from CD or DVD. $\_$

This prompt is only made for a few seconds before the system will attempt to boot the underlying OS, so you will need to react quickly.

Note: It is possible to suppress this prompt completely during the ISO/USB flash drive creation stage. If the prompt is disabled then the DR ISO/USB flash drive image will always booted by default. Please refer to CRISP documentation which describes how to do this.

To support devices (for example a new mass storage controller) not supported in the current DR environment, WinPE5 or WinPE10 allows drivers for any device to be injected at any time post boot. Refer to the section titled <u>Load a Driver</u> for information on how to do

this. Ensure you add the correct driver version; 64-bit for WinPE5/WinPE10.

#### 6.2 WinPE5 or WinPE10 based NBMR Recovery Console

When the **NBMR WinPE5 or WinPE10 Environment** is booted, a Windows installation-like boot procedure is started.

During the boot process, WinPE5 or WinPE10 drivers for your **Plug and Play** devices will be loaded - in particular the **Mass Storage** devices and **Network Adapters**. When the WinPE5 or WinPE10 system has booted it is possible to remove the CD/DVD or USB flash drive if you wish.

Note: the DR Console will automatically reboot 72 hours after starting. This is an operating limitation of the Microsoft Windows WinPE5 or WinPE10 environment.

Please wait while your PnP devices are loaded.

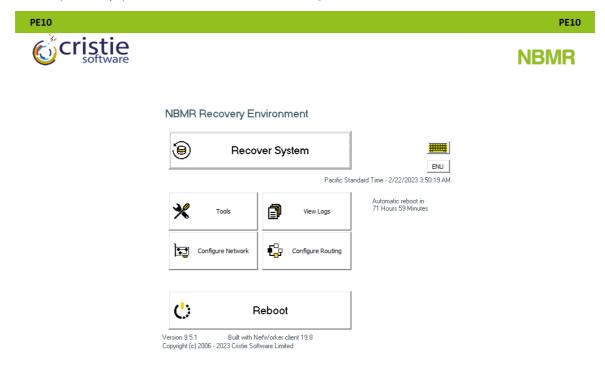

PE10 PE10

When this sequence completes, the NBMR Recovery Environment will be shown.

#### 6.2.1 NBMR Recovery Environment Main Menu

When you boot the **WinPE5** or **WinPE10** DR environment (the WinPE5 and WinPE10 versions are very similar), you will see the **NBMR Recovery Environment** Main Menu as below:

PE10 PE10

Prior to beginning the restore operation you may configure the network and/or the network routing as necessary. Click the

icons to do this.

Automatic reboot in

A reboot countdown clock is shown 68 Hours 14 Minutes. This indicates how much time is available before the WinPE5 and WinPE10 recovery environment automatically reboots. Note this is a Microsoft constraint for the WinPE environment.

You may configure the format of the displayed date/time and the keyboard layout, by pressing the locale FNU icon. Note this icon will be shown according to the locale of the host system used to create the ISO/USB flash drive using the CRISP utility so it may not match the version shown here. So if, for example, the ISO/USB flash drive was built on a machine configured with a UK locale it will be displayed as

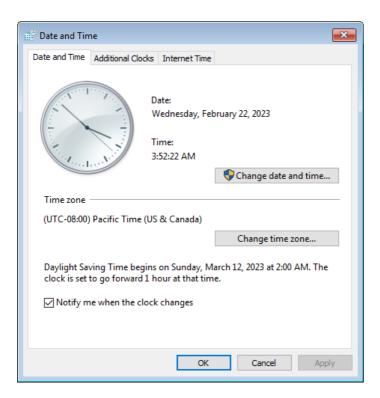

By default the standard display uses a keyboard layout to match the default locale as discussed above. However, this may be changed to one of the listed alternatives. Note that this does not change the display language which is always English.

Select **Date**, **Time** and **Time Zone** to configure the time zone for the recovery.

Note: the Additional Clocks and Internet Time tabs are operational. In fact it is possible to synchronise the system time with an NTP time server if required.

Finally if your recovery environment does not provide keyboard support (perhaps a driver issue) use the on-screen keyboard which can be displayed by clicking this then shows a clickable keyboard at the bottom of the screen. The keyboard layout displayed will correspond to the currently selected locale.

Use this for any data entry.

Note the DR environment requires a working mouse as a minimum.

#### 6.2.2 **Begin the Restore Process**

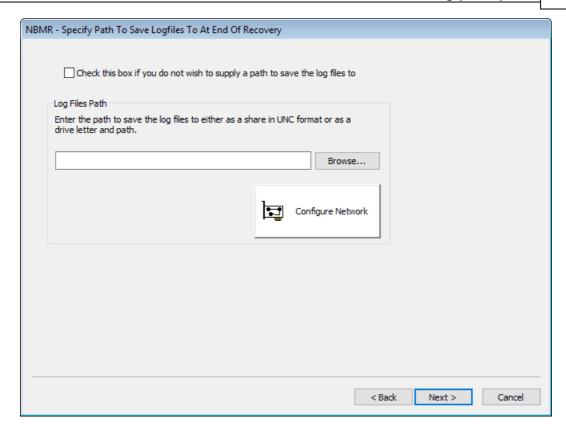

Click the **Recover System** option to begin the recovery sequence.

#### 6.2.2.1 **Logfile Save Path**

Before starting the restore process you should configure a location to save the recovery logs. This can be a network location or physical media (such as a USB flash drive). The logs will be automatically saved to the configured location at the end of the restore process without further intervention.

For example, use the option to first map a network share location and then Browse to select a folder on the share.

If you do NOT want to automatically save the the logfiles please check the tick-box to skip this step.

Check this box if you do not wish to supply a path to save the log files to

Click Next > to continue to the next step.

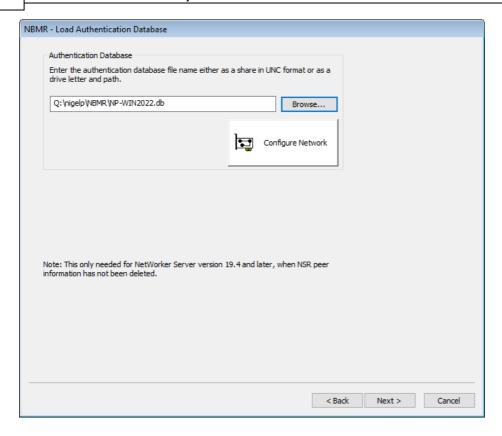

You will still have the opportunity at the end of the restore process to save the logfiles if you wish.

#### 6.2.2.2 Specify Authentication Database

First specify the location of the Dell EMC NetWorker<sup>™</sup> server **Trust** file. This is used to establish authentication to the server and should have been copied to an available network share or external device such as a USB drive after the backup.

This only applies if you are using Dell EMC NetWorker™ server version 19.4 or later.

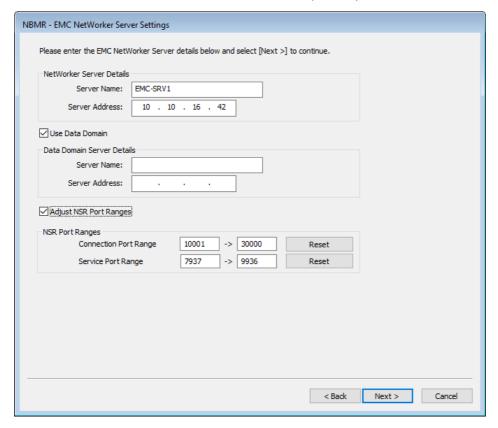

If the server used for the backup is earlier than version 19.4 then skip this step.

Click Next > to continue.

#### 6.2.2.3 Specify Dell EMC NetWorker™ Details and Recovery Date/Time

The next step of the automatic recovery identifies the location of the Dell EMC NetWorker<sup>TM</sup> Server and Client used to back up the system.

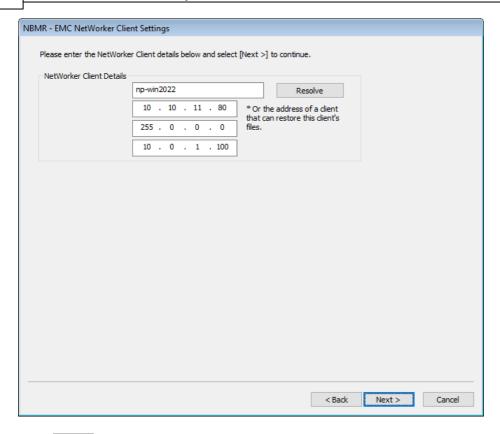

If DNS is working correctly in your network, entering the server name will automatically retrieve the server IP address. If the address is incorrect please set manually. The same applies for the client name and IP address. Similarly, use Resolve to retrieve the IP address of the client if DNS is available.

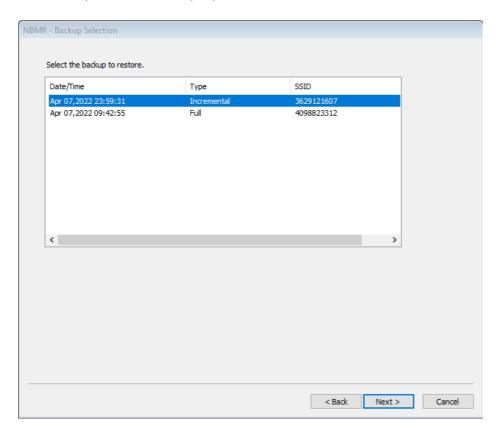

Select **Data Domain** if this has been used in the backup and then add the Data Domain server details. Additionally if your server uses non-standard NSR port ranges tick **Adjust NSR Port Ranges** and change accordingly.

Click Next > to continue and set the client details of the host to restore.

Click Next > to proceed. If more than 1 recovery point is detected on the server for the source they will then be displayed like this.

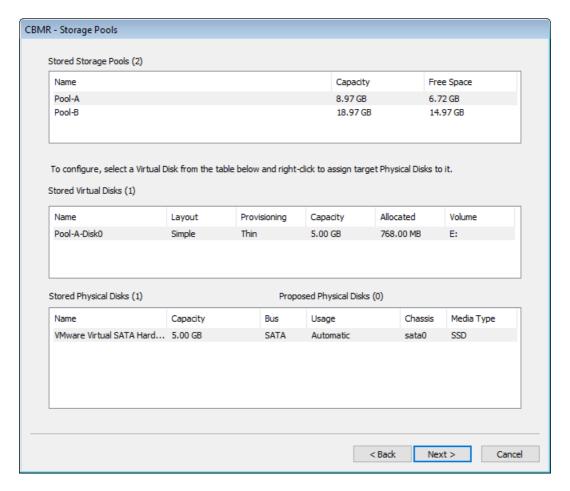

Select the required restore point from the list. Latest is shown at the top. Select Next> to continue.

#### 6.2.2.4 Storage Pools

If your original source host contained any Windows Storage Pools then this step will be run to allow the pool/disk setup to be configured. If no Storage Pools were configured in your selected backup this step will be skipped.

Note: Storage Pool recovery only works with the WinPE5 version of the NBMR DR environment. Do not use the WinPE10 version for Storage Pool recovery.

The pool/disk configuration dialogue looks like this:

The pool configuration requires you to map the original pool/virtual disk configuration to the physical disk layout detected on the target. This may have more or fewer disks than the original so this re-mapping needs to be done manually.

There are 3 sections in the dialogue:

- a list of the original configured pools with their corresponding capacity and the free space at the time of the backup.
- a list of the original virtual disks defined for a selected pool together with the corresponding virtual disk layout, provisioning, capacity, size in use and volume

letter.

 a list of the original physical disks and the proposed physical disks discovered on the target system for the selected virtual disk.

To assign physical disks to a virtual disk right-click the virtual disk to display the Virtual Disk Layout dialogue.

This is a recovery of a Windows 2019 server with 2 Storage Pools, named Pool-A and Pool-B. Pool-A is currently selected which is showing the Virtual Disk that was in the Storage Pool on the source system. The screenshot below shows the Physical Disks that the Virtual Disk was built from on the source system. There were 2 of them and they were all SATA (shown as Bus Type SATA).

Note that the **Proposed Physical Disks** has a count of zero, i.e. there are no target Physical Disks selected yet to recreate this Virtual Disk from, where **Stored = Source system** and **Proposed = Target system**.

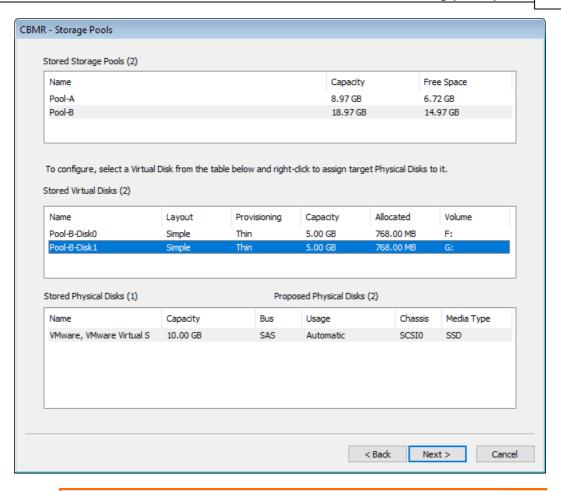

Right-click on the virtual disk, to display the disk selection dialogue.

In the example above the 2 target physical disks that makeup the original virtual disk are selected. Note the proposed disk count is now non-zero.

Repeat this process for all the remaining virtual disks in each pool. This results in a configuration similar to this:

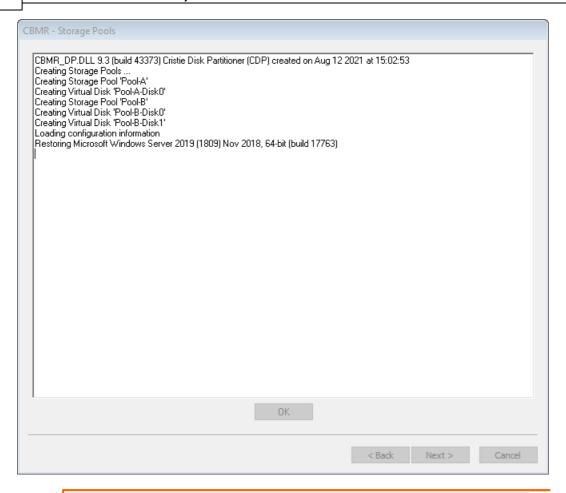

Note: There are some constraints on this configuration. For example, it is not recommended to have fewer or more physical disks mapped to your target virtual disk compared with the original source configuration.

Now click Next > to continue or < Back to return to the previous dialogue.

At this point the Storage Pools and virtual disks will be created.

Note: if no target disks are assigned during the Storage Pool step then recovery will still proceed but no Storage Pools will be restored.

Recovery now runs as normal with no further Storage Pool configuration required.

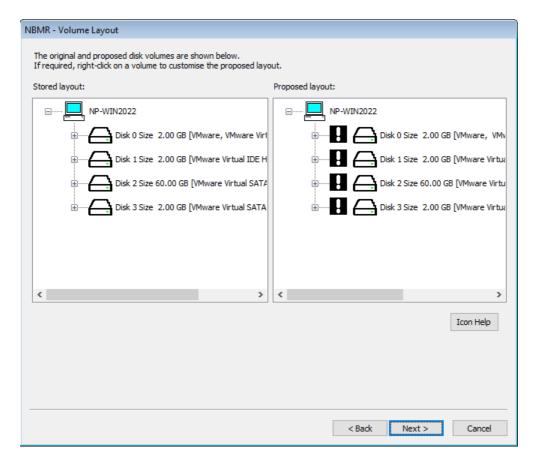

There are certain constraints with this release of Storage Pool support.

- Storage Pools and virtual disks are recognized by NBMR WinPE5, so if you boot a target system that has them, then WinPE5 will see them and mask out the "real" disks resulting in only the virtual disks being shown.
- The use of NVMe type disks when using VMWare WorkStation is not recommended when using Storage Pools.
- Physical disks used in Storage Pools should have minimum size of at least 8 GB.
- Only the NBMR WinPE5 DR environment is supported for recoveries of Storage Pools.
- During the Volume Layout phase you can right-click on target disks and swap them etc, but you can't swap a Storage Pool virtual disk with a real disk or vice-versa.

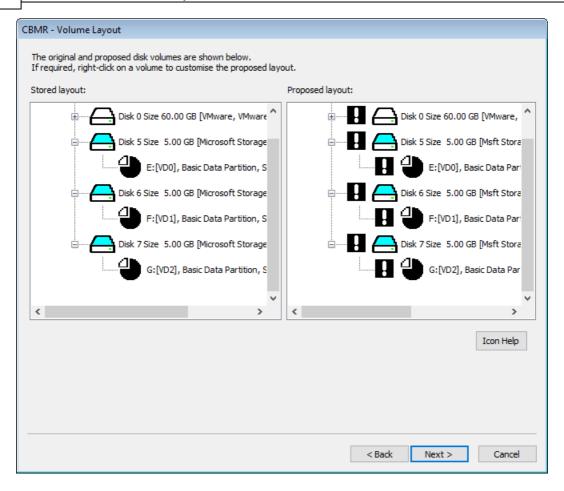

#### 6.2.2.5 Confirm Volume Layout

The next step in the **Automatic recovery** shows a list of the disks and partitions to be recovered.

For a system with Storage Pools the Volume Layout will resemble this example:

The left-hand panel of the dialogue shows the original disk layout and partitions. The right-hand panel shows how the recovered disks will be partitioned after the recovery.

A white tick box next to a disk signifies that the disk and its underlying partitions will be left intact. Placed next to a partition/volume means that the corresponding partition/volume WILL NOT be partitioned.

A white exclamation mark placed next to a disk means it **WILL** be partitioned during recovery. Placed next to a partition or volume means that the corresponding partition/volume **WILL** be partitioned.

A black/white exclamation mark placed next to a disk means at least one partition/volume **WILL** be partitioned.

A white box indicates that the disk will be completely ignored during the recovery.

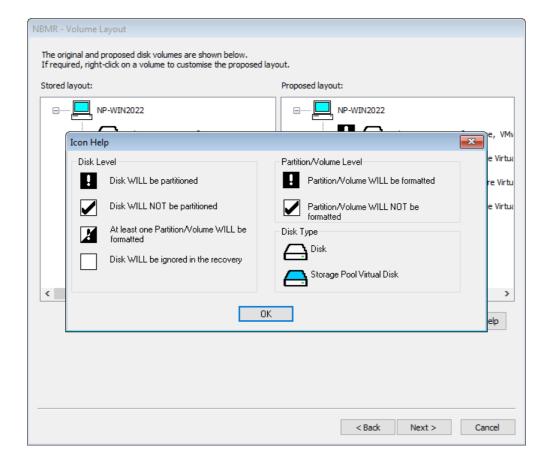

There are 2 disk types available:

indicates a Storage Pool virtual disk

Click on the con Help button to display a summary of this:

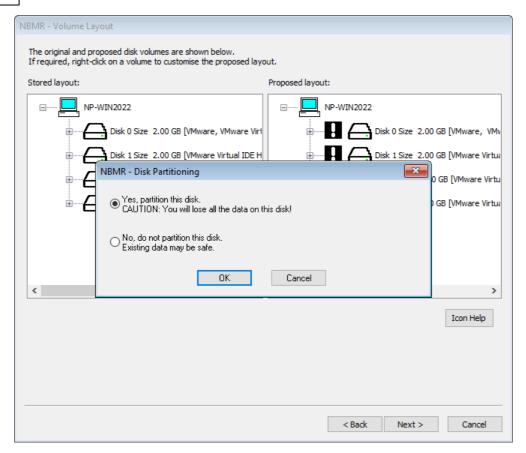

When the recovery is to the original system, the contents of both panels will look similar if the number of disks is the same. Possibly the disk sizes will be different.

When performing a recovery to a dissimilar system, the disk mapping can be much more complex. Some of the criteria used to judge the disk mapping are:

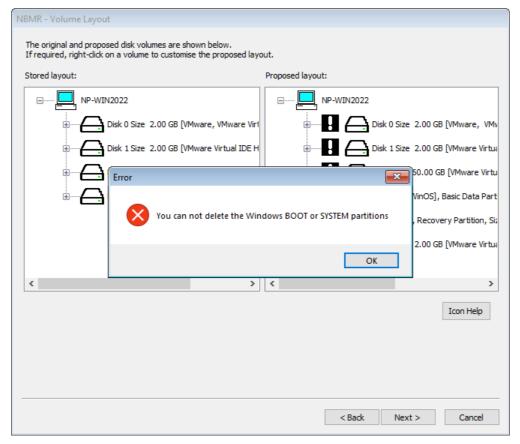

- disk geometry
- disk capacity
- if currently formatted, the disk signature

You may right-click on any disk shown in the right-hand panel to select whether the disk will be partitioned or not.

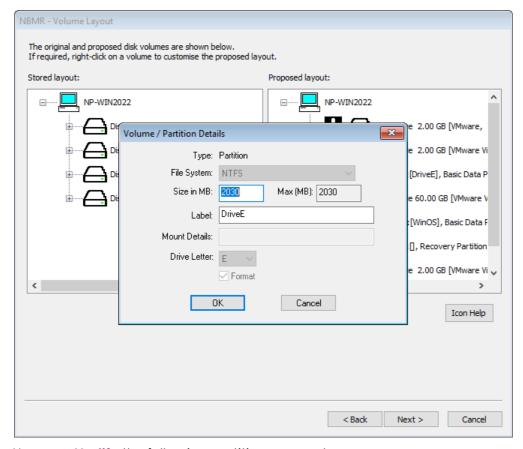

Any attempt to incorrectly turn off formatting will result in this error:

You may also right-click on a partition to allow you to selectively modify the partition

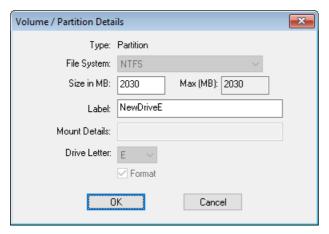

parameters.

You may Modify the following partition parameters:

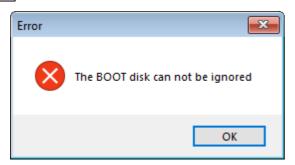

- size in MB (only if disk is shown with a
- label
- format (yes/no)

The screenshot below shows an example:

If you attempt to either not format or delete a Windows system partition, an error such as this will be displayed:

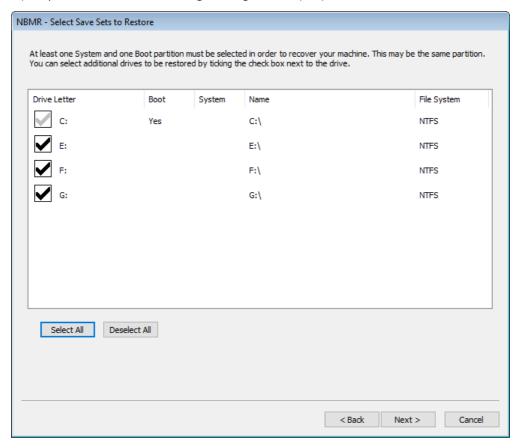

At this stage, nothing has happened to the disks. Press Next> to continue with the recovery.

#### 6.2.2.6 Select Save Sets To Restore

The **Save Sets** are now located on the Dell EMC NetWorker<sup>™</sup> server (based on your client inputs) and then the following dialogue is displayed:

Generally each **Save Set** represents a disk partition or volume. Put a tick against each save set that should be restored. Use the **Select All** button to quickly select all save sets.

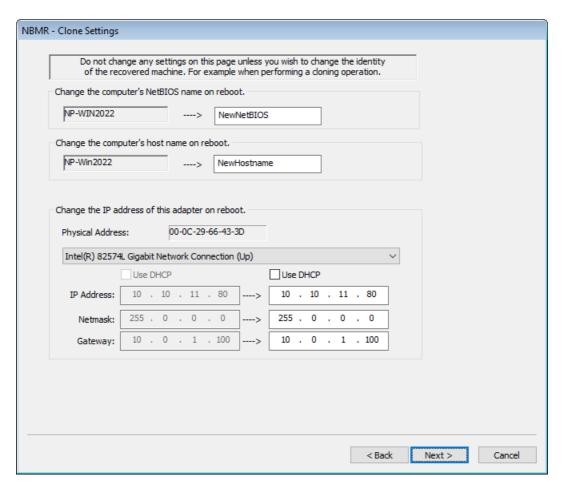

Note: the system and boot partitions (even if on different partitions) will always be restored by default and it will not be possible to deselect them.

Click Next> to continue to the next step.

#### 6.2.2.7 Clone Settings

Use this dialogue to change the recovered system's **hostname** and **IP addresses** if required. Select to use either DHCP or enter a valid static IP address.

You may change the IP address for each NIC interface independently. NICs that are currently connected to a network are tagged with (Operational).

Note: The Use DHCP tick-box shown on the left side of the dialogue indicates whether DHCP was used on the source system. If its ticked it indicates DHCP was used on the source. If unticked a static IP address was used.

If you wish to retain the current hostname and IP addresses leave the fields at their default values and select Next> to continue to the next section.

Note: When you click on the "Next >" the button will change to "Finish", when you click on "Finish" the restore will start. If dissimilar hardware is detected, then when you click on "Next>" the Dissimilar Hardware dialogue will be displayed instead.
Click "Finish" on that dialogue to start the restore.

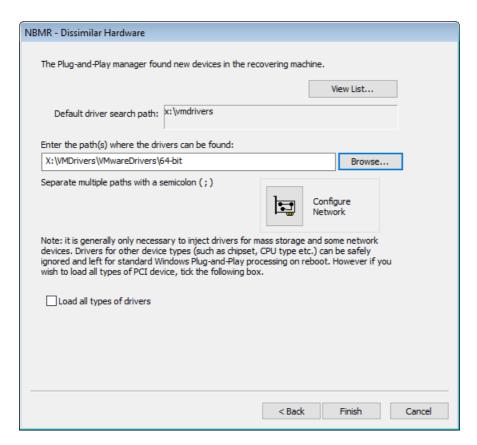

When recovering to a system with a different MAC address (generally during a dissimilar DR), the default IP address settings default to DHCP and not the original IP.

The Next > button will change to Finish. Click this when ready to continue.

#### 6.2.2.8 Dissimilar Hardware

Next, the DR process performs a check to determine if there are new devices in the recovering machine that were not present in the original system. If this is true, then this is a 'dissimilar' DR and the following dialogue will be shown to allow the user to specify the location of the new driver files for these devices.

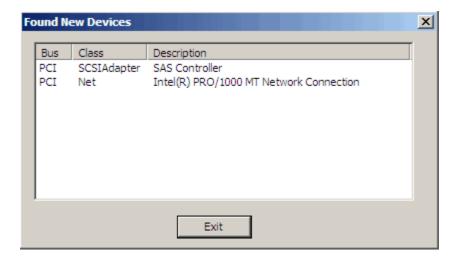

Specify the default path or paths to be searched for the missing driver files. The paths may

be on a local device (eg. a USB disk) or a network share. Use the button if you need to map a network share. In either case, the paths must be accessible to the WinPE5 or WinPE10 environment.

Select View List... to see a list of the new devices.

Configure Network

Ensure the specified path or paths contain the correct 64-bit drivers for the dissimilar machine. At the end of the DR sequence, the specified paths will be searched for the missing drivers and automatically injected into the recovered system.

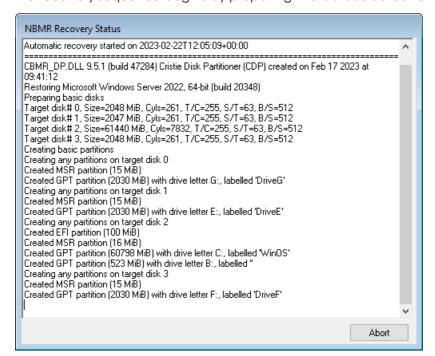

By default, it is only necessary to inject drivers for mass storage devices and, in some some cases, network devices. The 'Load all types of drivers' tick box will force the DR to look for all drivers in addition to mass storage and network devices. For example, this could include graphics cards, USB and chipset devices, but these are rarely required and not recommended.

Note that if drivers are not found for the new boot disk then, although WinPE5 or WinPE10 will be able to recover the files to the disk, there is a good chance that it will not boot correctly.

Press Finish> to proceed with the recovery.

### 6.2.2.9 Disk Recovery Sequence

The recovery sequence begins by preparing the disks selected for the recovery:

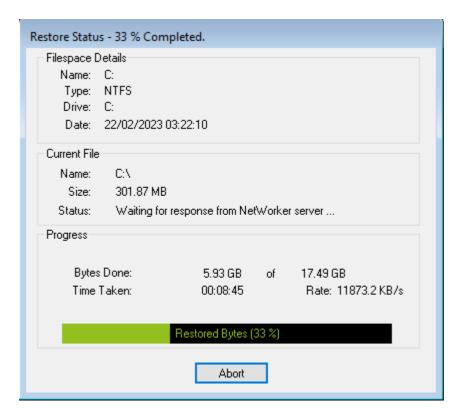

This involves:

- disk mapping original layout to new
- cleaning (removing any existing disk partitions)
- removing any existing dynamic volume databases
- re-creating the partitions
- converting to dynamic volumes if required
- formatting to the required partition type
- create partition/volume mount points
- make bootable volumes active

The next step is to recover the save sets to the selected target disks/partitions. A new window appears containing the restore status of recovered files and progress bars indicating how much of the backup has been restored. This display also shows the recovery statistics in terms of time, size and throughput.

This process may take some time if the backups are large. You may select the Abort button to terminate the file recovery process, but this may leave the disk or partition in an unpredictable state which may render it unusable.

If any errors occur during the recovery, an error message will be shown in the window. Refer to the logs post recovery to establish the cause of any error.

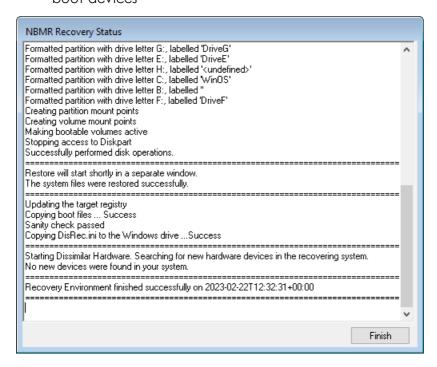

The final steps of the recovery are to:

run a sanity check to determine if all the expected boot files are present on the

boot volume

 run a dissimilar hardware check to determine if new drivers are required for new boot devices

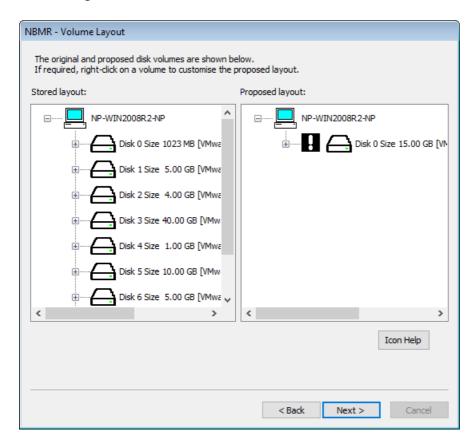

Press Close to return to the **Recovery Console** main menu. At this point you may want to view the recovery logs and perhaps copy the logs to a local device or remote share before selecting to reboot. Copying the recovery logs to external media is recommended in case you need to contact Cristie Software Ltd. Support.

Note: recovery logs are also saved to the recovered system to the NBMR installation sub-folder 'Temp' (e.g. "C:\Program Files\Cristie\NBMR\Temp").

### 6.2.2.10 Disk Scaling

In situations where the target system has fewer or smaller disks than the original system, Disk Scaling will come into effect.

The above example shows a recovery from an original system with 8 physical disks, to a target system with only one disk. The target disk is also much smaller than the original system disk.

In this scenario, NBMR will select as many disks to recover as possible (in this case only one disk - the boot disk). In addition, it will scale the partitions down in proportion to their original size and occupancy. This can be complicated by having, say, mirrored dynamic volumes when the mirror will need to be broken - if only one disk exists on the target (or it has been tagged as not to modify).

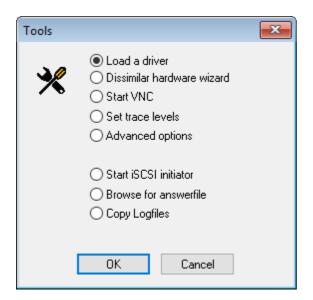

Note 1: the Volume Layout dialogue will only show disks in the left hand panel that can be removed.

Note 2: during a recovery to a system with larger disks, the partition sizes will remain the same as the original by default. However, in this case, it is possible to increase partition size manually during the recovery by right-clicking on the partition icon and selecting Modify.

### 6.2.3 Tools

There are a number of tools that can assist with the recovery process. They are all collected under this command button:

The options available are:

- Load a driver
- Dissimilar Hardware Wizard
- Start VNC
- Set trace levels
- Advanced options
- Start iSCSI initiator
- Browse for answer file
- Copy Logfiles

**Load a driver** allows a new mass storage or NIC driver to be injected into the running booted WinPE5 or WinPE10 DR environment. This would be used, for example, to support a mass-storage (disk) device not currently supported out-of-box. This should be done prior to starting the DR sequence.

The **Dissimilar Hardware Wizard** will allow drivers to be injected into the recovered system when the target hardware has different devices from the original (eg. RAID controllers). Normally, this will be done automatically as part of the DR sequence and will not need to be run manually.

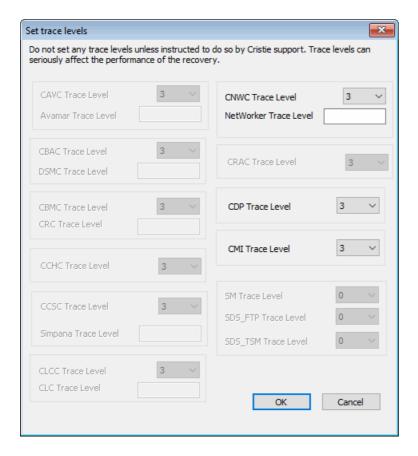

**Start VNC** will run a VNC server within the WinPE5 or WinPE10 environment, allowing external VNC clients to remotely connect during the DR session. The start process will provide you with the current IP address of the WinPE5 or WinPE10 environment, which you will need to specify in the VNC client.

Note: the VNC connection is also password protected. The VNC feature is intended for diagnosing DR problems under the guidance of Cristie Support, who will provide

the password upon request.

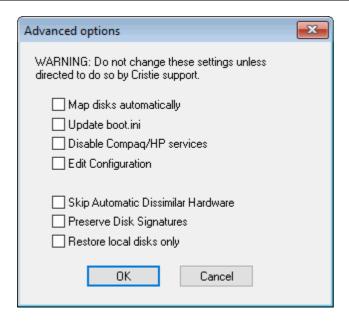

Set trace levels allows the DR log file trace to be increased or decreased as required:

It is recommended that the trace levels are only changed when advised to do so by Cristie Support staff. This is because they could have a severe impact upon the performance of the backup restore process.

**Advanced Options** should only be selected when advised to do so by Cristie Support staff.

Start iSCSI initiator - please contact Cristie Support if you wish to use this feature.

**Browse for answer file** allows an automated DR answer file to be selected which then triggers an immediate automated DR sequence.

**Copy Logfiles** allows all the current logfiles created as part of the recovery process to be zipped up and copied to a network share or local device (such as a USB flash drive).

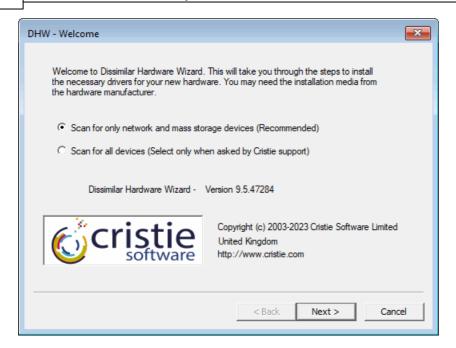

### 6.2.3.1 Dissimilar Hardware Wizard

A restore to dissimilar hardware is normally detected during the Automatic or Manual DR sequence. Drivers will be injected automatically at the end of the restore sequence if a source location has been provided. However, if this process has failed for some reason, or additional drivers are required to be injected into the recovering machine, then this **Dissimilar Hardware Wizard** (DHW) tool is provided.

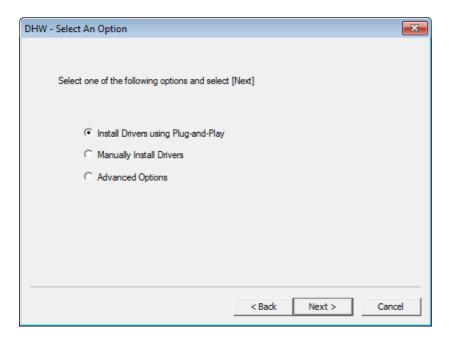

Note: it is only necessary to load the drivers for the hard disk, NIC and, rarely, the HAL. Drivers for the hard disks and NIC can be determined by Plug-and-Play (PnP) and may be readily identified. However, changes required in the CPU model via a change in HAL cannot yet be determined by PnP - these need to be loaded manually.

If you wish to scan for just Mass Storage and Network devices (the minimum required to boot a dissimilar system), select Next> to continue to the next step of the Wizard. This is the recommended option. Under the guidance of Cristie Support, you may be asked to scan for all devices. In this case, tick the 'Scan for all devices' box before selecting Next>.

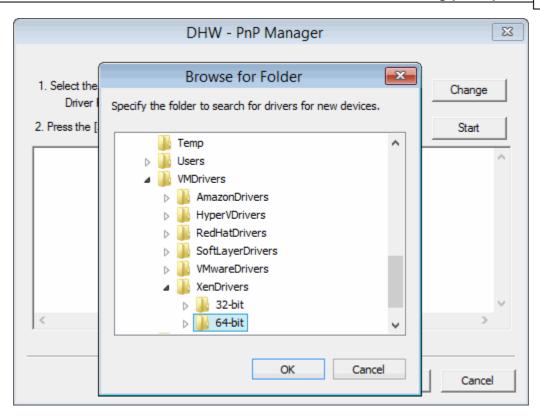

Select the 'Install Drivers using Plug-and-Play' option:

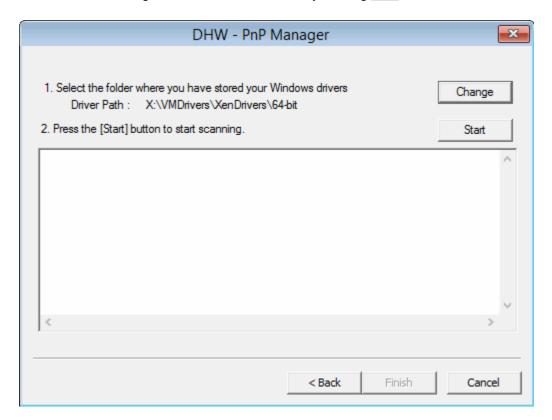

### Install Drivers using Plug-and-Play

The window appears empty to start with. The set of drivers located on the recovery CD is the default choice, but in practice they should not be used. Instead, change the driver search path to where you have actually located your drivers (for example, to a network share or another CD) with the **Change** command button.

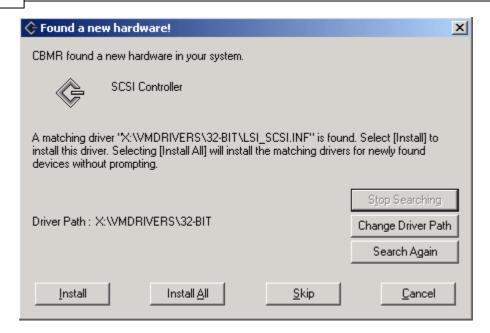

In the example above, the driver search path is changed to the VMware drivers on the WinPE boot CD. Begin the PnP driver detection by clicking Start.

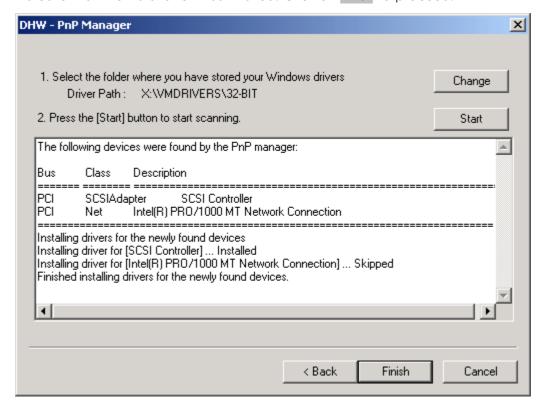

The process checks the devices that it can detect and when it finds one that does not have a driver loaded, it will offer to install it. The example below shows an LSI SCSI device being detected:

If you are satisfied that the found driver path is correct, click on <a href="Install">Install</a> and the driver will be installed. The device scan will continue and may find, for example, other mass storage or network devices. Follow the steps above to install.

Drivers are usually .sys files. The .inf files define which driver files need to be loaded for a given device. You may need to confirm the location of the driver files for each device, or possibly find the path where they are stored. When you have the correct path, click on OK and the Wizard will look for more.

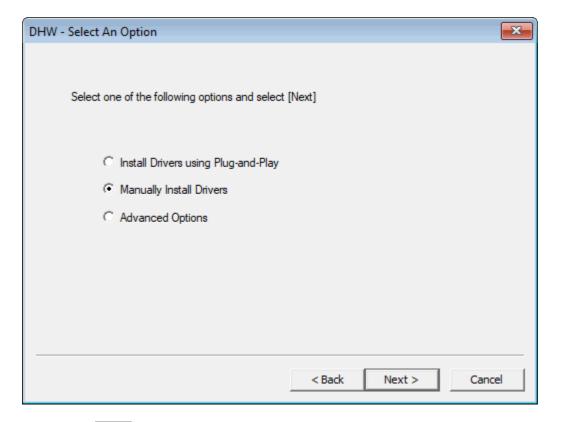

Once all of the drivers of the detected devices have been processed, the Wizard will indicate that the installation has finished. Click on Finish to proceed.

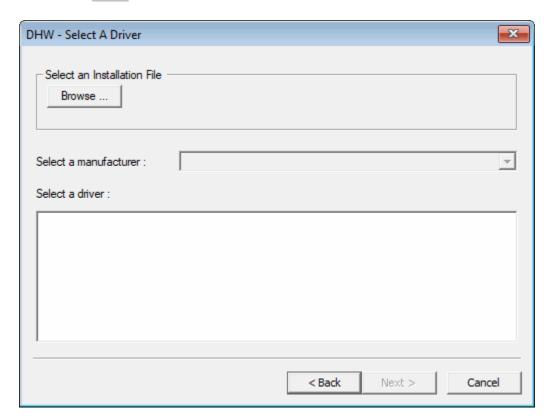

### Manual Installation

Typically, you would only manually install a driver for a CPU/HAL change. Select 'Manually Install Drivers' from the option menu:

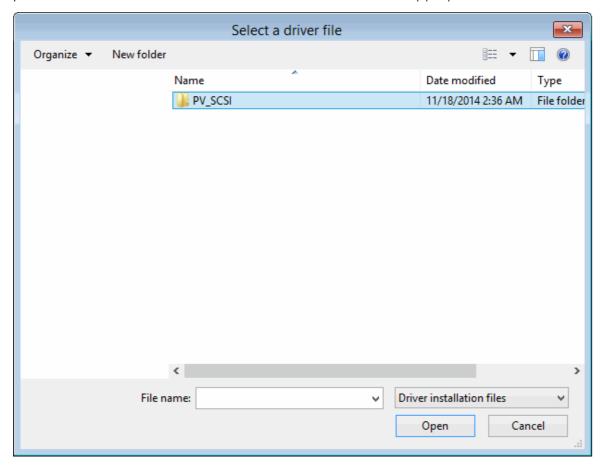

Then select Next>.

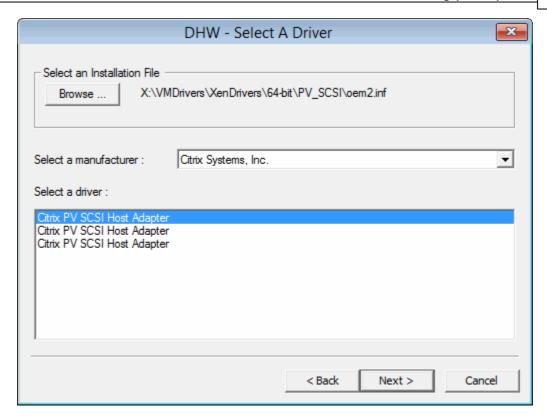

Select Browse... to locate the driver or HAL file you need by browsing to the appropriate folder that holds the .inf file. If you need to load the driver from another machine, then you can browse to a share on that machine and then to the appropriate folder.

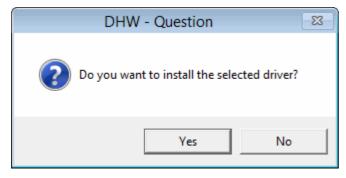

Here we are selecting the Citrix PV SCSI controller driver:

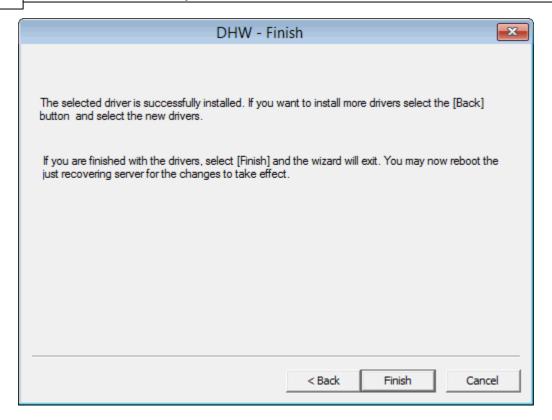

The Wizard allows you to select drivers that are grouped by manufacturer. Select the actual driver that you wish to install and click Next>.

After you confirm the selection, the Wizard determines which files need to be installed. You are given the opportunity to change the location from which they are loaded if required..

When the drivers have been installed, the Wizard allows you to go back to install another device driver or Finish the process.

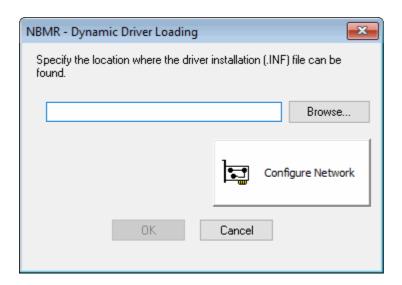

### 6.2.3.2 Load a Driver

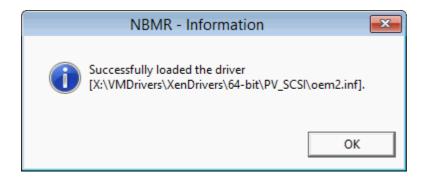

This option allows a new **Mass Storage** or **Network Interface card** driver to be loaded into the WinPE5 or WinPE10 environment. Use this when WinPE5 or WinPE10 does not have a built-in driver for your hardware.

For example, if the DR environment does not show any disks to be recovered, you can inject a new mass storage device driver for the device and retry the DR Wizard.

You will be prompted for the location of the driver INF file. Use the Configure Network button to map a network share if necessary:

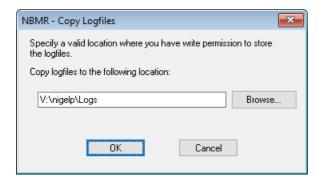

The INF file and other associated driver files (such as the .SYS file) can be located on a CD, USB device or a network share. The following confirmation dialogue is displayed if the driver is loaded successfully:

### 6.2.3.3 Copy log files to removable media or network location

Since all log and error files generated during the recovery are only transitory (ie. they are lost as soon as the Windows WinPE5 or WinPE10 environment exits), this option allows you to copy the files to a local device or remote network share for permanent record before booting the recovered system.

Use the **Cristie Network Configurator** utility to setup a network share first. All the files are compressed into a single ZIP file so that they can be easily sent to Cristie Support when required.

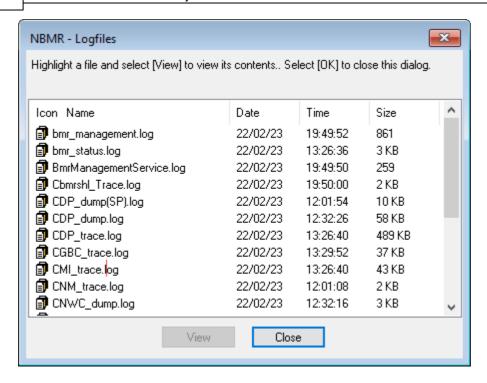

The example shows files being copied to a network share V:\nigelp\LOGs.

Note: the logs are automatically written back to the recovered system after a successful recovery. They are saved to the NBMR installation sub-folder 'Temp'.

# 6.2.4 Show a list of log files for viewing

This main menu option allows the log files produced during the recovery to be viewed using Notepad. Normally, viewing this information is only required to diagnose a problem with the recovery.

The important files are (this is not an exhaustive list):

bmr\_management.log - remote VA management log,

**bmr\_status.log** - restored disk and registry configuration log, eg. disks/partitions created summary etc.

**BmrManagementService.log** - remote VA management log, Used by Cristie Support. **cbs\_Ic.log** - Used by Cristie Support.

**cbmrshl\_trace.log** - contains a summary of the main menu shell operations. Used by Cristie Support for diagnosing shell operations.

**CDP\_dump.log** - contains general information regarding the system BIOS, disk configuration and timezone details of the original system.

**CDP\_trace.log** - contains a detailed summary of how the partitions were restored. Used by Cristie Support for diagnosing disk configuration problems.

**CGBC\_trace.log** - Cristie Generic Backup Client log file.

**CNM\_trace.log** - contains network library information. Used by Cristie Support.

**CNWC\_dump.log** - contains NetWorker server/client summary information. Used by Cristie Support.

 $\textbf{CNWC\_trace.log} \text{ -} contains \text{ NetWorker restore session information. Used by Cristie Support.}$ 

**CRM\_trace.log** - contains the Recovery Manager log. Used by Cristie Support.

**CRMWizard\_trace.log** - contains the Recovery Manager log. Used by Cristie Support.

**dhw\_log.log** - contains a summary of Dissimilar Hardware Wizard activities. Used by Cristie Support for diagnosing new driver problems.

**discovery\_main.log** - contains a summary of network discovery activities. Used by Cristie Support for diagnosing network problems.

**Network.log** - contains NIC hardware summary, current network configuration (eg. IP address, gateway IP address etc) and routing table.

**PeNetCfg\_trace.log** - Configure network tool log.

PeRouteCfg\_trace.log - Network Routing tool log.

**setupapi.log** - contains a summary of the Plug and Play devices detected by WinPE5 or WinPE10 as it boots. Used by Cristie Support for diagnosing <%

**Version.log** - Used by Cristie Support to determine version of Cristie NBMR software and DLLs deployed.

# 6.2.5 Cristie Network Configurator Tool

The **Cristie Network Configurator** tool provides extensive facilities to configure the network during the recovery process. It offers the following features:

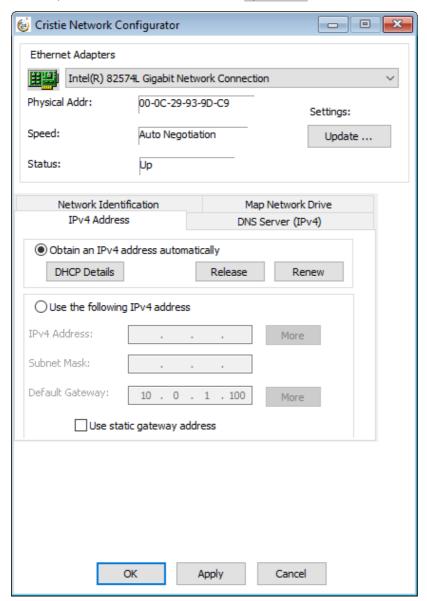

- supports multiple NICs
- configure individual NIC parameters for duplex mode and link speed
- the ability to select DHCP allocated or static IPv4 IP addresses
- the ability to setup DNS server IPv4 IP addresses
- the ability to setup the Network Identification of the recovering system
- allow file shares to be set on the recovering system (using IPv4 IP addresses)
- map/unmap network drives

Note: The WinPE5 or WinPE10 DR environments for NBMR only do not support IPv6. The IPv6 stack has been removed.

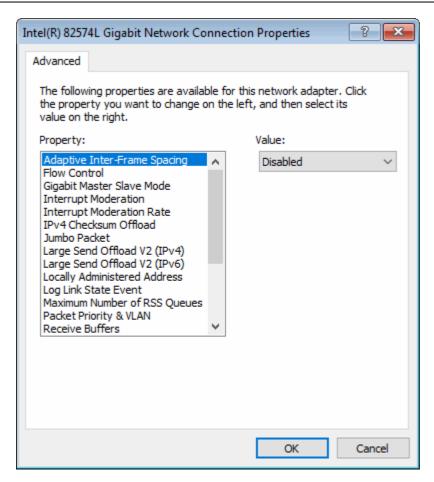

### 6.2.5.1 Configure NIC Parameters

It is possible to change both the link speed and duplex mode for any NIC detected on the recovering target system. Select the desired NIC (there could be more than one) from the drop down box and then select <a href="Update...">Update...</a>...

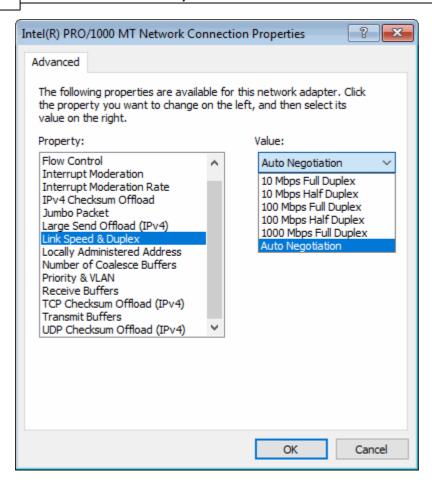

The resulting display offers numerous NIC properties that can be changed. This property list is dependent upon the NIC - ie. not all properties will be available for all NICs.

To change the NIC speed or duplex setting, select the corresponding Property from the dialogue and then select the required value from the Value drop down box as shown below:

Again, note that the speed/duplex settings available are NIC dependent. Auto Negotiation is generally the NIC default setting. Other NIC properties may be changed as required.

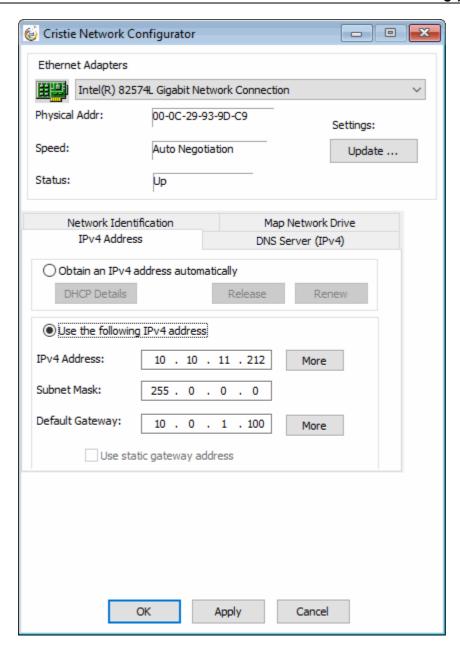

If the NIC is currently connected to the network then the *Status* will be shown as **Operational**. Otherwise the NIC is considered to be **Non-Operational**.

### 6.2.5.2 Assign Static or DHCP IP Settings

Normally the WinPE5 or WinPE10 DR environment will start with DHCP enabled and active. However, if a static IP is required, use the 'Use the following IP address' option to manually configure.

First ensure the desired network adapter is selected from the drop down list. If a static IP address is to be applied, select the 'Use the following IP address' button. This will automatically deselect the default DHCP option and allow the static IP parameters to be defined.

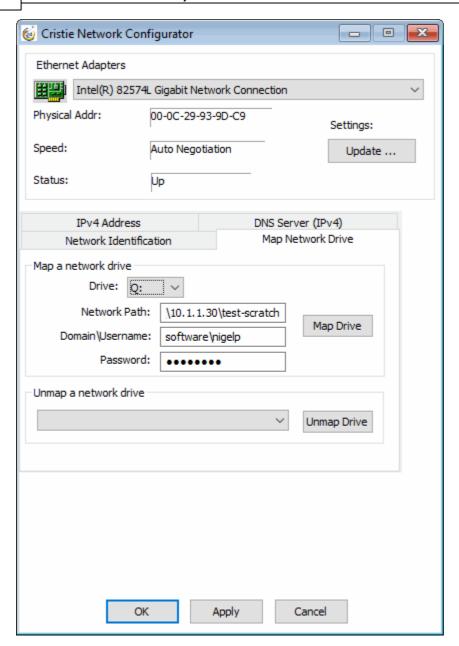

Set the new IP address, subnet mask and gateway IP address. The More button will allow the system to have more than one static IP address. Click on Apply to confirm the settings for the selected adapter.

This feature will also allow the DHCP lease to be released or renewed, as required.

# 6.2.5.3 Map a Network Drive

In order to simplify access to network resources, the Network Configurator allows you to map a network drive to a network share. Start the Cristie Network Configurator from the **Tools** menu and select the **Map Network Drive** tab.

Select the drive letter that you wish to allocate from the **Drive** drop-down box and type in the share name that you wish to associate with it. Also specify the network credentials to be used to access the share.

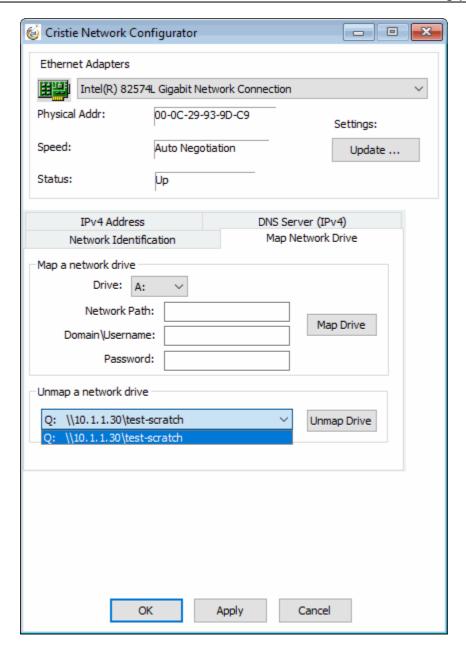

Note: The network path may be specified either by hostname or IPv4 address.

Press Map Drive to confirm the share operation. If successful, the share will be added to the **Unmap a network drive** drop down list.

### 6.2.5.4 Disconnect Network Drives

If you need to disconnect a mapped drive for any reason, this option allows you to do this. Just select the drive that you wish to disconnect from the Unmap a network drive drop down list and then click Unmap Drive.

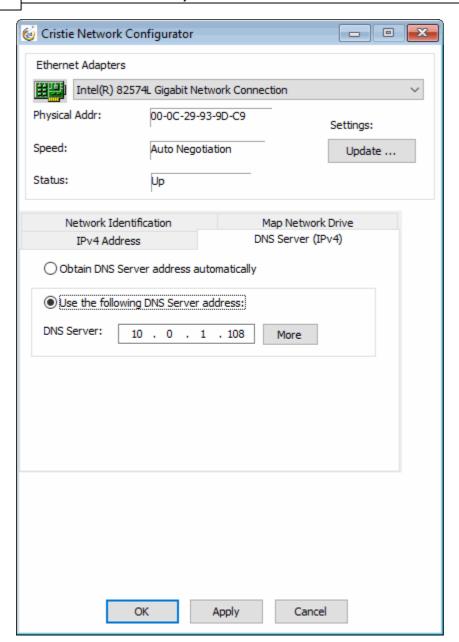

The mapped drive is removed from the list to confirm the operation.

### 6.2.5.5 Setup DNS Servers

DNS server IP addresses are automatically set when the WinPE5 or WinPE10 DR environment boots. However, options are provided to allow DNS server IP addresses to be manually set if required.

Note: WINS servers are not currently supported by this tool.

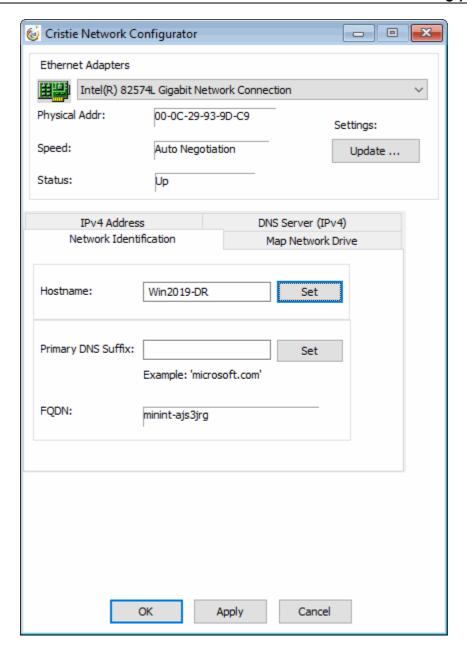

Select the 'Use the following DNS Server address' radio button and enter the new DNS IP server address. If required, select the More button to add several DNS IP addresses. Press Apply to activate the new address.

# 6.2.5.6 Setup Network Identification

Click the **Network Identification** tab to setup a new hostname for the recovering system. This allows the WinPE5 or WinPE10 hostname and Primary DNS suffix to be changed during a DR session if required. These details are transient and only apply only while the WinPE5 or WinPE10 DR session is running. They are not applied to the recovered system when it reboots after the DR session.

Enter the new Computer Hostname and press Set to confirm the change.

# 6.2.6 Cristie Route Configurator Tool

The **Cristie Route Configurator** tool provides extensive facilities to configure the network routes during the recovery process.

It offers the following features:

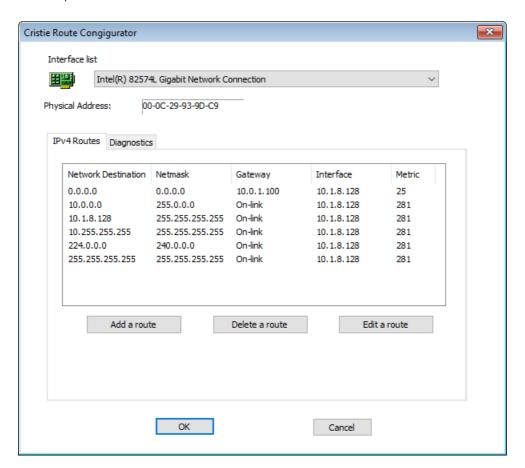

- supports multiple NICs
- provides the ability to add/modify/delete a route
- supports IPv4 routes
- allows IPv4 ping/tracert diagnostics to be run on a target hostname or IP address

Note: The WinPE5 or WinPE10 DR environments for NBMR do not support IPv6. The IPv6 stack has been removed.

### 6.2.6.1 IPv4 Routes

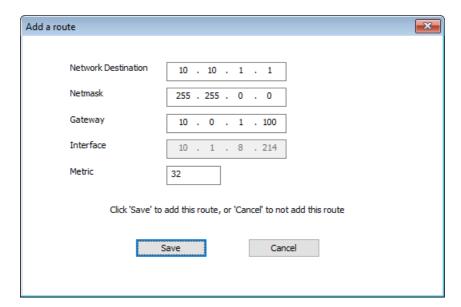

Click the IPv4 Routes tab if not already selected. First select the required interface from the drop-down list.

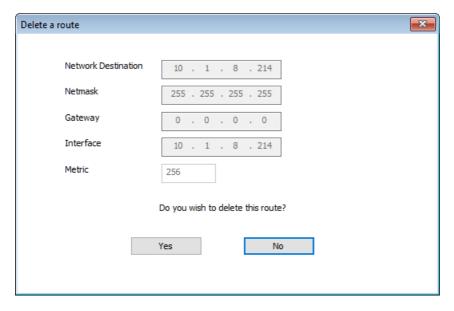

You may then add a new route, delete or edit an existing route.

To add a new route, click Add a route. A data entry dialogue is displayed. To add a route identify the new route network, the route netmask, gateway and route metric. Click Save to add the new route or Cancel to cancel the creation of the new route.

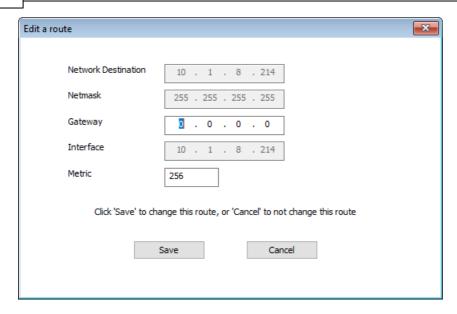

To delete an existing route, highlight the desired route in the displayed list and click Delete a route. A confirmation dialogue is displayed. To delete click Yes to confirm or No to cancel the delete operation.

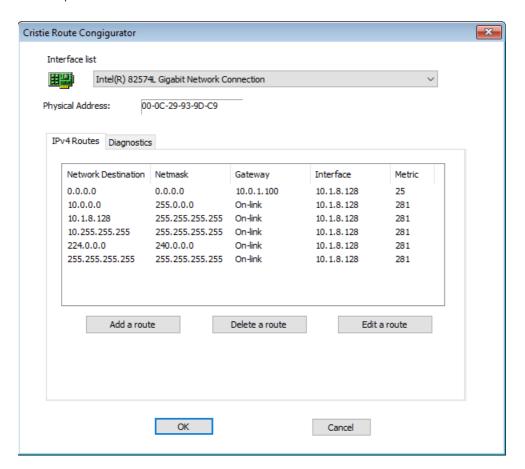

To edit an existing route, highlight the desired route from the displayed list and click Edit a route. A data entry dialogue is displayed. Only the network gateway and metric can be changed however. Click Save to make the changes or Cancel to abandon the changes.

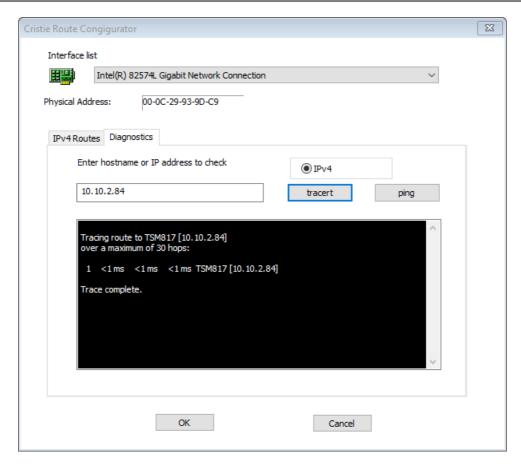

### 6.2.6.2 Diagnostics

Click the diagnostics tab if not already selected. First select the required interface from the drop-down list.

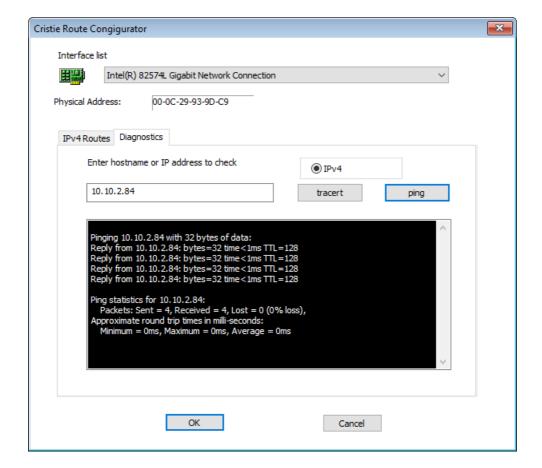

Enter either the hostname or IPv4 IP address of the network target. Click tracert to examine the route to the selected target.

Click ping to check connectivity to the selected host. Click OK to exit the dialogue.

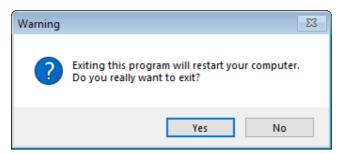

# 6.2.7 Reboot

After a successful recovery, select Reboot to exit the WinPE5 or WinPE10 environment and boot the recovered system. Note you may need to change the default boot device to be the OS boot disk since it may still be configured to boot from the NBMR DR boot environment.

Click Yes on the confirmation dialogue to restart or No to continue running the DR console:

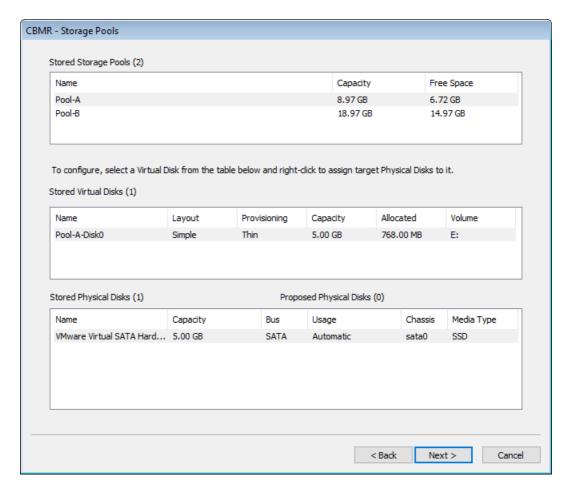

# 7 Appendices

# 7.1 Storage Pool support

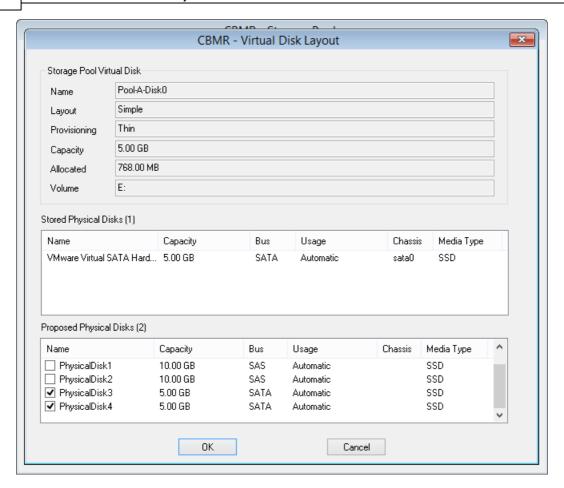

Windows **Storage Pools/Spaces** are now supported for Windows Server 2012 R2, 2016, 2019, 2022 and Desktop 10.

However, it is important you keep a note of your Storage Pool disk configuration since this will need to be manually re-configured during the recovery process. The Storage Pool names, physical and virtual disks will be saved, but not the disk mapping. For example, this is a typical Storage Pool configuration dialogue:

Right-click on a virtual disk to display the physical disk selection dialogue.

Note: nothing special needs to be done during the backup process as long as all the virtual disks in the pools are backed up.

Storage Pools created on iSCSI disks and restored to the same disks will need to be manually attached using the iSCSI initiator tool in the recovery environment **before** beginning the recovery sequence.

Similarly Storage Pools created on USB disks and restored to the same disks must be connected to the target host **before** booting the recovery environment.

Note: For a local USB disk to become part of a Storage Pool, it must be set to 'Not Removable' in the Windows settings Device properties. Otherwise it will not be offered as a candidate disk when setting up the pool.

If recovering a system with Storage Pools to a hypervisor or cloud, any source machine iSCSI or USB disks can be emulated with virtual disks on the target.

Note: Only the WinPE5 DR environment supports the recovery of storage pools at the moment.

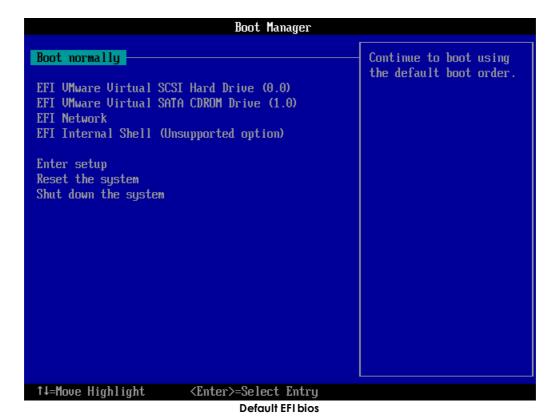

# 7.2 UEFI and MBR BIOS support

NBMR has the ability to convert a legacy BIOS boot configuration to a more modern EFI based boot configuration during a Windows clone operation. It does this automatically by creating an extra EFI partition on the detected boot disk and adding the requisite boot files to this partition. Regardless of the original boot disk type it will be converted to GPT format in the clone target system.

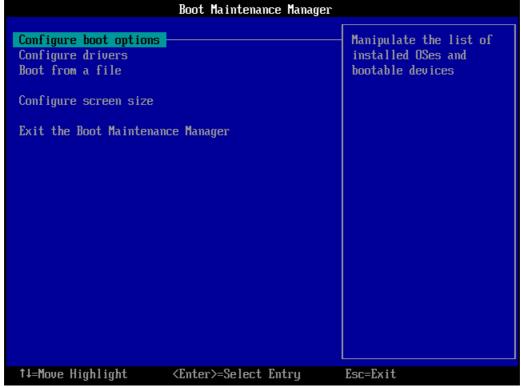

Note: This EFI BIOS conversion feature is only supported on compatible target environments such as physical machines, VMware Workstation™ and VMware vSphere™.

Prior to booting the new EFI clone target manual intervention will be required to configure a new boot option. An example of this obtained from a VMware Workstation™ clone target is shown below. Other virtual environments will be similar.

Select Enter Setup option

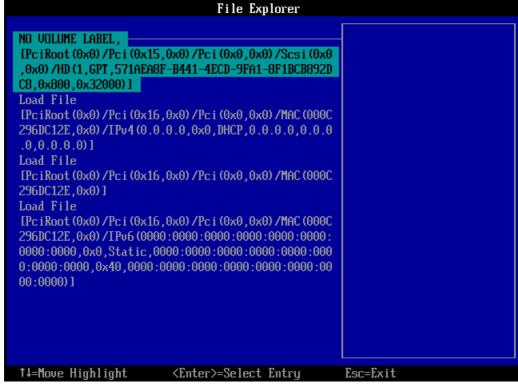

**Select Configure boot options** 

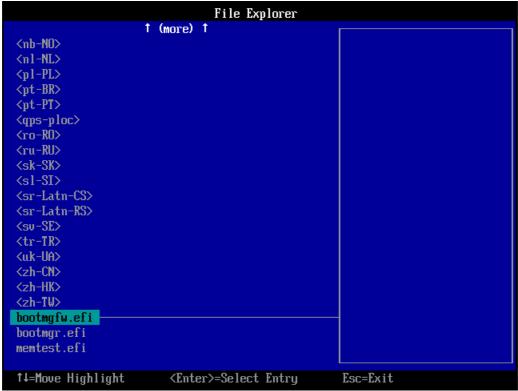

# Add boot option Delete boot option Enable or disable boot option Change boot order Go back to Boot Maintenance Manager Main Page 14-Move Highlight Configure boot option Add EFI application or removable media as boot option removable media as boot option Esc=Exit

Select add boot option

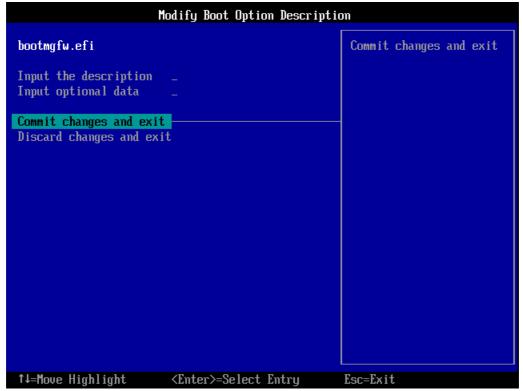

Select boot partition in File Explorer

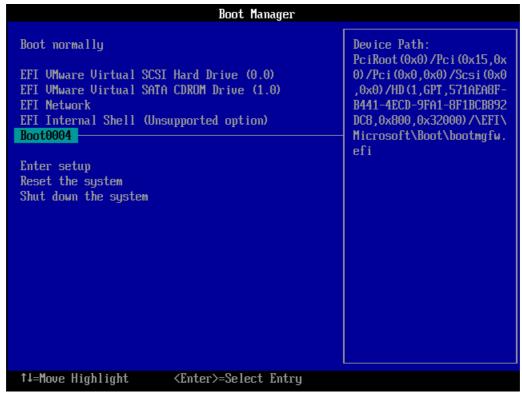

Select EFI boot image

Modify boot option description and commit

New boot option configured

This feature supports clone source systems with a split boot configuration (i.e. Boot and System partitions on different disks or different Boot/System partitions on the same disk). The split boot configuration will be replicated on the clone target subject to the GPT conversion mentioned above.

This feature also supports source systems configured with a Windows dynamic boot volume (e.g. a dynamic mirror).

It is also possible to clone an EFI based source system to a target configured with a legacy BIOS. In this case any GPT based boot disks will be converted to legacy MBR disks and the EFI partition removed.

# 8 Cristie Technical Support

If you have any queries or problems concerning your Bare Machine Recovery for NetWorker product, please contact Cristie Technical Support. To assist us in helping with your enquiry, make sure you have the following information available for the person dealing with your call:

- NBMR Version Number
- Installed OS type and version
- Any error message information (if appropriate)
- Description of when the error occurs
- All Cristie log files relating to the source or recovery machine. This is very important to help us provide a quick diagnosis of your problem
